Fig. 6 in the above article should have appeared as follows.

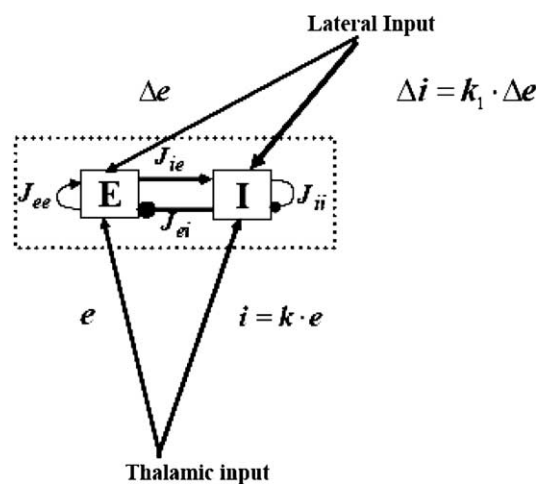

Fig. 6. A schematic representation of a cortical hyper-column (Adini et al., 1997, 2002), consisting of two interconnected sub-populations (*E*-excitatory, *I*-inhibitory), used here to model contrast discrimination. Both *E* and *I* populations receive external input from the thalamus (*e*, *i*) and from within the cortex (Δe , Δi).
