Eigenvalue Asymptotics for Dirichlet-to-Neumann Operator

Abstract:

Let $X$ be a compact manifold with the boundary $\partial X$ and $R(\lambda)$ be a Dirichlet-to-Neumann operator:

$$R(\lambda): f \rightarrow u|_{\partial X} \text{ where } u \text{ solves } (\Delta + \lambda^2) u = 0, \ u|_{\partial X} = f.$$  
We establish asymptotics as $\lambda \rightarrow +\infty$ of the number of eigenvalues of $\lambda^{-1} R(\lambda)$ between $s_1$ and $s_2$.
