Eigenvalue Asymptotics for Dirichlet-to-Neumann Operator

Abstract:

Let $X$ be a compact manifold with the boundary $\partial X$ and $R (\lambda)$ be a Dirichlet-to-Neumann operator: $R (\lambda): f \mapsto u|_{\partial X}$ where $u$ solves $(-\Delta + \lambda^2) u = 0$, $u|_{\partial X} = f$. We establish asymptotics as $\lambda \to \pm \infty$ of the number of eigenvalues of $\lambda^{-1} R (\lambda)$ between $s_1$ and $s_2$.
