Abstract:

Let $F_q$ be a finite field with $q$ elements and odd characteristic. A pair $(G, G_t)$ of mutually centralized reductive subgroups of $Sp_{2n}(F_q)$ is called a reductive dual pair. By means of the Weil representation of $Sp_{2n}(F_q)$, Roger Howe introduced a correspondence $\Theta : \mathbb{R}(G) \rightarrow \mathbb{R}(G_t)$ between the category of complex representations of these subgroups. Here we discuss how this correspondence relates the Harish-Chandra series of $G$ to those of $G_t$. If time allows, we will discuss how this correspondence can be expressed as a correspondance between unipotent Harish-Chandra series.
