

Astro I

June 28, 2010

Contents

1 Guidelines and Outline	3
2 Overview: The content of the observable universe, Experimental techniques $2.5 \times [2\text{hr}]$	4
2.1 Content: In the Galaxy	4
2.2 Content: Out of the Galaxy	5
2.3 Observational techniques	6
3 Stellar structure, evolution and end states	8
3.1 Binaries [1hr]	8
3.2 Stellar structure: Main sequence	11
3.2.1 Structure eqs. [2hr]	11
3.2.2 $L(M)$ scaling at low M : Kramers (ff/bf) opacity [2hr]	12
3.2.3 Characteristic times	13
3.2.4 Convection	13
3.3 Nuclear energy production $2 \times [2\text{hr}]$	14
3.3.1 Nuclear reactions	14
3.3.2 Solar neutrinos	16
3.4 Post main sequence evolution $2 \times [2\text{hr}]$	18
3.4.1 Post main sequence evolution: Cores	18
3.4.2 Post main sequence evolution: Envelopes	19
3.5 Compact objects: NS/BH	21
4 Cosmology	22
4.1 Newtonian cosmology [2hr]	22
4.2 Radiation evolution	23
4.3 Relativistic evolution, $z > z_{\text{eq}}$	24

4.4	GR basics: I. Equivalence principle, metrics, Newtonian limit [2hr]	25
4.4.1	The equivalence principle and the concept of a metric	25
4.4.2	Newtonian limit- slow motion in a stationary weak field	27
4.5	The Friedmann-Robertson-Walker metric [2hr]	28
4.6	GR basics: II. Physics laws, gravity, dynamics $1.5 \times [2\text{hr}]$	31
4.6.1	Tensors and the laws of physics with gravity	31
4.6.2	Gravity	32
4.6.3	Dynamics	33
4.7	Perturbations $1.5 \times [2\text{hr}]$	35
4.8	The parameters of the universe	37
5	Spectacular explosions	39
5.1	Preliminaries: Hydrodynamics	39
5.2	Core collapse SNe	42
5.3	Supernova remnants (SNRs): Thermal emission	45
5.4	Some comments on Neutron Stars (NSs)	46
5.4.1	Pulsars	47
5.4.2	X-ray pulsars and X-ray binaries	48
5.4.3	Double NSs	49
5.5	SNRs: Non thermal emission, collisionless shocks, and cosmic-rays (CRs)	50
5.5.1	Collisionless shocks	50
5.5.2	Particle acceleration	51
5.5.3	Galactic cosmic-rays	55

1 Guidelines and Outline

The course is intended to provide students with a broad overview of the constituents of the observable universe, with a sense of what the main achievements of astrophysics are, and with a sense of what the main current open questions are. The course is not intended to be comprehensive in the range of topics covered, or exhaustive in the discussion of particular topics. Rather, following a broad phenomenological overview we will focus on several subjects for which a rigorous yet simple discussion of key achievements and questions is possible.

Few observational features that can be rigourously and simply explained are preferable to broad story telling. However, some of the latter is unfortunately unavoidable. We will try to make a clear distinction between the two.

Content:

1. Overview: The content of the observable universe, Experimental techniques.
2. Stellar structure, evolution and end states.
3. Cosmology.
4. Spectacular explosions.
5. Overview: Main topics of current research.
