Multiplicities for $DS(L)$ in osp-type.

Abstract:

The Duflo-Serganova functor is a cohomology functor relating representation theory of Lie superalgebras of different ranks.

This is a tensor functor preserving superdimension.

Serganova conjectured that the image of a finite-dimensional simple module L under Duflo-Serganova functor is semisimple. Heidersdorf and Weissauer established this conjecture for \mathfrak{gl} -case and described $DS(L)$. In my previous talk I sketched a proof of semisimplicity for osp-type. In this talk I will explain how to compute the multiplicities in $DS(L)$.

This is a joint project with Thorsten Heidersdorf.
