Real Galois cohomology of semisimple groups

Abstract:

In a 2-page note of 1969, Victor Kac described automorphisms of finite order of simple Lie algebras over the field of complex numbers  $\mathbb{C}$ . He used certain diagrams that were later called Kac diagrams. In this talk, based on a joint work with Dmitry Timashev, I will explain the method of Kac diagrams for calculating the Galois cohomology set  $H^1(\mathbb{R}, G)$  for a connected semisimple algebraic group  $G$  over the field of real numbers  $\mathbb{R}$ . I will use real forms of groups of type  $E_7$  as examples. No prior knowledge of Galois cohomology, Kac diagrams, or groups of type  $E_7$  will be assumed.
